- record table variable, scalar variable, temporary tables and permanent tables values when calling any database code line that is executed by database server

- SQL Standard Debugger in MS Visual Studio could not support this feature.

- supports any execution monitoring parameters. You can set the maximum duration for execution monitoring for each line of executed code

- is written in native code and is an independent executable that is loaded into the memory of the SQL Server process by SQL Server Loader.

This is a native DLL that can be loaded by SQL Server process not requiring any configuration on SQL Server. - is working with most version of SQL Server and the latest version is: SQL Server 2014 - can be used both in development and production SQL server - supports all supported objects (scalar variables, table variables, temporary tables and permanent tables). You can add and delete these objects. - has a simple command line tool. You can use it for debugging database code not supported by Visual Studio or inside Visual Studio (or you can use it from any shell) - database

code history. You can print and return to previous state (calls). Useful for developers working with triggers and other database code with dependencies.

- you can save database code execution history as a.txt file
- you can set a breakpoint in any line of code executed by the database server
- you can start a new debugging session at any time, even if you are already debugging
- you can provide debug information to the execution with many features such as:
- set max execution time for database code;
- print database execution calls with parameters;
- set a breakpoint in any

line of code executed by the database server - set a breakpoint in any code line declared inside stored procedures, functions, triggers or views - set a breakpoint in any code line executed by a remote query (Stored Procedure, user-defined function or table-valued function) - set a breakpoint in any database code line declared inside temporary tables - set a breakpoint in any database code line declared inside Permant tables - set a breakpoint in any database code line declared inside table variables - execute update, insert, delete, or select statement with parameters in any database code line -

see the value of each database object when calling a database code line: - scalar variables, - table variables, - temporary tables, - permanent tables - database code history - you can print/return to previous

SQL Ultimate Debugger is a powerful SQL server tool that helps developers debug SQL Server database code in both development and production environments. SQL Ultimate Debugger has a great set of features that help a developer to observe the execution of a particular code line(s)

in the target database. This is an all-in-one debugger, so you can add it to any SQL Server tools such as SQL Server Management Studio, Visual Studio and others as a tool extension so that it shows you exactly the same information as the SQL Server query analyzer. Features of SQL Ultimate Debugger are as follows:

- The source database can be SQL Server, MySQL, Oracle, DB2, etc.
- The target database can be SQL Server, Oracle, DB2, MySQL, etc.
- The source and the target databases can be local or remote.
- There are no restrictions on databases server versions and

platforms. - It can debug both GUI stored procedures and those created with the SQL Server Management Studio text editor and DML statements and triggers. - SQL Ultimate Debugger is completely free. - It is an ad-supported tool. - Support any SQL objects including procedures, views, functions, variables, etc. - It can debug your stored procedures, functions, trigger and any other. - It is compatible with Visual Studio 2010, 2010 Express, 2012, 2013, 2015 and Visual Studio 2017. - It is for both 32 bit and 64 bit platforms. - It supports the load of SQL Server and SQL

Server Express databases - It supports all SQL Server editions. - It can inspect values of scalar variables, table variables, temporary tables and even permanent tables. - It can display many interesting values for each traceable element (scalar variables, table variables, temporary tables, permanent tables) within executed database code such as stored procedures (SP's) and user-defined functions (UDF's), triggers. - It provides performance indicators and statistics (call count, total, average and maximum execution time) for each line of executed database code. - Includes many new

features that were not available in the Standard SQL server debugger. - Tested and verified against SQL Server 2005, SQL Server 2008, SQL Server 2012 and SQL Server 2014 servers. - Automated memory clean-up. - It automatically disables debug markers to speed-up the execution of the SQL statement. - It supports the 6a5afdb4c

- *Debugger is convenient to debug existing stored procedure code (classic in SQL Server 2000 and 2005, TSQL with @@trancation directive)
- *Tabular and binary format support
- *Execute multi lines with parameters
- *Table and Variable watch, show expressions as well as their value
- *Trace columns (additional for variables)
- *Memory allocation show
- *Debugger includes similar error handler to Visual Studio
- *Object and column filters
- *Debug sql statements can be stopped at any point
- *Save

result to file *Recompile whole code at once *Can be debugged by SQL Server and IIS *Global variable filters *Next error menu *Debugger has ability to show/hide original code *Run SQL script without needing to debug it. *SQL assistant for stored procedure generation *Executes SQL statements from scripts *SQL assistant for functions *SQL assistant for foreign keys *Dynamic SQL assistance *Support for 1-n schemas *Edit/remove application variable assignments *View navigation history *SQL agent support *Start debugging a stored procedure with the Visual

Studio debugger (SQL Server 2005 and above)

- *Drag a breakpoint to be the start of the script
- *Set error handler
- *Execution state for a stored procedure (before calling, after returning)
- *Set a breakpoint on the beginning of the stored procedure
- *Set a breakpoint on a user defined function
- *Set a breakpoint on the end of a user defined function
- *Edit a user defined function
- *Edit a SP with the debugger.
- *Show or hide fields from the editor
- *Show or hide code from the editor
- *Show or hide lines from the editor
- *Show or hide variables from the editor
- *Show or hide

columns from the editor *Delete temporary table *Inject SQL *Refresh cached plan *Supports UDF's
*Supports table variables *Supports table value constructor (TVC)
*Supports views *Supports indexes
*Supports triggers *Supports tables
*Supports views *Supports any type of temporary table *Supports any type of permanent table *Supports any type of scalar table variable *Can debug with IIS (http/https) *Execute sql statements that exist in a SQL script.
*Auto complete help *SQL assistant
*SQL assistant to create

What's New In?

SQL Ultimate Debugger is SQL Server best-in-class database developer tool. SQL Ultimate Debugger is the only tool that allows you to inspect any value on any object in any area of SQL Server database code. Ultimate Debugger has a unique technology and features that provide the most comprehensive tool for analyzing database code, monitoring execution with IIS, and more:

1. Inspect all values of temporary tables, table variables, scalar and complex variables, and even their internal array structures.

SQL Ultimate Debugger not only allows you to inspect the

values of scalar variables, table variables, temporary tables, but it can also monitor your database in a live environment while the execution takes place. 2. Inspect any value on any object including arrays, permanent tables, and temporary tables. Ultimate Debugger records SQL server database execution calls, providing detailed information on each traceable element (scalar variables, table variables, temporary tables, permanent tables) within executed database code such as stored procedures (SP's) and user-defined functions (UDF's), triggers. 3. Execute SP's and UDF's directly from

SQL Ultimate Debugger. Ultimate Debugger not only allows you to debug a specific execution with known parameters (as you normally do in Visual Studio) but it can monitor your database in a live environment.

4. Debug SP's and UDF's while they are executed many times per second by the IIS. Ultimate Debugger also provides performance indicators and statistics (call count, total, average and maximum execution time) for each line of executed database code.
