You can either buy Adobe Photoshop Elements outright, or you can buy the annual subscription to get the latest version with all the features and enhanced stability and performance. The following sections compare Photoshop to Photoshop Elements, and all the inclusions and features of the two versions. Contents Table of Contents Hardware Needed to Use Photoshop If you want to install Photoshop on your Mac or PC, you will need a computer with an Intel or AMD processor. A decent video card is a must for getting the most of Photoshop when it is working at its best. It also needs lots of free hard drive space so that it can cache, store and load all your graphics and file formats. When you've got that in place, you are ready to install Photoshop Elements. Adobe Elements will run on nearly any PC or Mac running Mac OS 9 or 10. Elements is available for Windows and Mac operating systems. CPU Processor: The CPU plays a vital role in the performance and speed of a machine. If you're looking at a low-end computer, the CPU will be considered the most important part because it's the only way to make the computer efficient. Intel and AMD both make CPUs, and you're able to buy pre-built computers that have either one or the other. If you're buying a computer, especially if it's a laptop, you're probably going to want a CPU with multi-core capability. The i3, i5 and i7 Intel processors can have four, six or eight cores each. The Athlon II processors can also have four, six or eight cores each. Whether you buy a faster, high-end CPU or a more economical one is up to you and what you want to do with the computer. RAM Memory: Computer memory is not the same as ordinary memory. Computer memory acts as a cache, allowing you to access stored graphics, files and software faster. You'll need at least 1 gigabyte, or 1,024 megabytes, of RAM in your computer to make good use of Photoshop Elements. A 2 gigabyte, or 2,048 megabytes, RAM card would be a good size for the average person who needs a lot of graphics options, such as panoramas and collages. That way, you can store files, photos and graphics in the background while you're working and then later click back to view them.

Over 200 students, alumni and faculty at Hamline University's Graduate School of Education and Human Development celebrated the first ever Grad School of Education Summit at the Hamline Alumni Center May 2-3. Students from the four Hamline graduate schools that comprise the Graduate School of Education: Education Leadership, Graduate Teacher Education, Education Psychology, and Educational Administration attended the weekend summit that brought together Hamline teaching and learning experts in development, evidence-based practices and other area-specific topics. The high-energy and packed event was led by Duke University's Kenneth P. Green School of Education Dean Duquesne L. Arnold, who's father, Lawrence F. Arnold was Hamline's Dean of Humanities and Fine Arts from 1945-1962, and has been instrumental in establishing the Graduate School of Education. "This is not just a teaching summit," noted Arnold. "It's a learning experience for both faculty and students. We're trying to bring back that sense of school community into the Hamline University environment. We want to be as thoughtful about the school community as we are about the student body. We want to bring our schools and our schools together, to have these coordinated events. So we have about 40 speakers and educators that will come from the various schools to speak." "We didn't really know what to expect when we got on this bus," shared Hamline Professor of Education Bruce Harper. "We knew it was going to be really fun, but we didn't know what the outcome would be. It's been really fun to see it grow into this giant event. I've heard from folks that have gone to it and I've heard from folks that haven't gone to it. But everyone is really talking about the event and really excited about it. So it's been a really good experience." About Duke University's Green School of Education A unit of Duke University, the Duke University School of Education is the world's largest, leading educator-research institution, both in enrollments and the number and size of programs offered. The school offers undergraduate and graduate degrees, including a Ph.D. in Teacher Leadership and Ed.D. programs, and is home to the nationally recognized Duke Social Context Project. The school also houses the Institute for Research on Education Policy and Practice, which conducts rigorous evaluations of complex, large-scale educational interventions. About Hamline University Hamline University has been educating students for 120 years in the Twin Cities, with locations in St. Paul and Eau Claire, Wisconsin

Key Determinants of Medical Professional Liability Claims: A Multilevel Perspective on Medical Errors. Medical malpractice insurance is growing in the US, despite limited evidence about how liability risk varies for certain providers and specific types of errors. More claims may indicate more malpractice or more effective risk management; however, claims may also arise when there are no errors. This study examined claims

and other characteristics of medical professionals to better understand the factors that increase claim rates and to develop hypotheses regarding the factors underlying claims. The study compared risk of claims among individual providers based on all claims, claims involving patients, claims involving procedural incidents, and claims involving defects. Risk factors for claims were assessed using a mixed-effects logistic regression model with individual providers as random effects. The baseline model also included specialty, academic status, specialization in patient safety, and physician's state of residence, as well as interactions between each of these characteristics with specialty and with state. The estimated coefficients quantified differences in risk for individuals compared with national averages. State of residence was a statistically significant risk factor for claim rates, but no other provider characteristics were significant. Claims were higher among solo and small group practices. Claims involving procedural incidents and defects were both significantly higher than claims involving patients. The data provide support for the hypothesis that increased claims are associated with more effective risk management strategies. Further investigation is required to explain the differences in practices across states. For the last 12 years, software-defined networks (SDNs) have been steadily getting more popular with telecommunications vendors and service providers. In theory, the SDN paradigm is supposed to enable network operators to provide a next-generation network that is more flexible, scalable, and controllable than traditional networks. In many cases, it is believed that SDN would eventually replace the existing networks. However, much work is required to adapt to SDN: SDN requires protocols and utilities to be developed to support its control and management functions. To date, SDN implementations have focused mostly on the operation of the controllers and the forwarding plane. The control plane is responsible for managing the network topology and for orchestration and provisioning of control services. The forwarding plane is responsible for transporting traffic across the network and forwarding it to its destinations. However, the control and data planes are tightly coupled in the typical SDN implementation today. This makes it difficult for service providers to leverage one legacy protocol for the transport of signaling and control traffic, while concurrently using another protocol for service data traffic.
