µHash is freeware, portable, and visual MD5 hashing tool for Windows. All operations are supported right from the start. When you start µHash, you don't have to worry about the quality of your PC, because all registry entries remain intact. Plus, µHash is an instant-run application, which means that it doesn't require you to sign up or register before it's can get started. How to Start µHash, and use? When you run it for the first time, a quick window pops up, and it instantly starts looking for hashes. The process it took was so fast, we still have the window open, while we're writing this. Hitting options is enough to make µHash perform detailed analyses. First, choose either of the supported file types. In our case, we decided to use text documents, and saved them to our desktop. Then, select whether you want hash code or MD5 file to be saved. Finally, we added a target list, by selecting files, and even folders, using either the file explorer, or drag and drop option. Once we finished, hit start, and let it do the work. Keep in mind that in order to perform hashing, you need to drop files, or folders into the target space. Once µHash completes, results are shown underneath. File names, and sizes are displayed too. In addition to that, there's the hash code, which, if you want it to, you can export to clipboard, or an MD5 file. To use the hash code file, one need to open an already generated MD5, and replace the hash code accordingly. It's that easy, which is precisely what µHash is all about. Even if you're not a computer junkie, you won't have any problem figuring out the steps. Of course, you can also import a custom hash code file, but it will take longer, and will have a slightly different process. The default value is sufficient for most users. µHash Tools: File Browser: MD5, hash code, and manual tool to convert strings to hash code. Custom hash code can be imported. Custom hash code generator: Automatically generate hash code from custom strings. Custom strings are converted to hash codes, based on an MD5 file. MD5 Hashing Check: Check MD5 file integrity. It compares hash codes, and generate
