There are several options for each category, including text, spirals, single flat area regions, surface boundaries, and section curves. There are many selection modes available. For example, you can select all points, lines (including polylines), arcs and circles,

polycurves, dimensions or surfaces, as well as select by type, layer, color or name. Transform objects and analyze data Items embedded in the project can be repositioned, rotated in 2D or 3D mode, scaled or mirrored. What's more, you can analyze vertex and center coordinates, arc diameters, angles, along with bounding boxes, among others.
