Much concern is placed on decreasing cost. Some engineers like using a 1-1 approach in designing a product. This leads to working towards getting the design manufacturability right at the beginning. This means that the design is thoroughly tested to improve manufacturability. The course helps you understand why there is a divergence in the following two questions:

Fabrics are used as sheet materials in innumerable applications ranging from hanging curtains to garments and automobile seats, and even as protective linings for many industrial components such as gears, bearings, and other rotating machinery.

Design and industrialization of synthetic fabrics for such purposes should take place keeping in view the fundamental requirements of fabric life and performance. Synthetic fabrics made today and to be designed and developed in future will need to provide performance characteristics that are far superior to those of natural fibers. This is because the latter show a deterioration with time and have to be replaced with fibers that are carefully selected for a given application. This series of text and theoretical chapters reviews the physical processes that govern the fabrication of cellulose-based fibers and the chemistry of the chemical bonding that links component atoms. It also deals with the methods of choice of the raw materials and the chemical processing stages leading to the formation of a cellulose fiber, the precursor to most textiles. A. S. Agarwal

Is a Phd student of mechanical engineering, Department of Mechanical Engineering, Jaypee Institute of Information Technology, Noida, India. He is working on several research projects, e.g. manufacturing and characterization of materials using composite processing techniques, design of new materials, analysis of spallation and structural failure mechanisms in optical fiber, design of wear and surface layer of materials by using composites. He also works as a teaching assistant in mechanical engineering department in Jaypee Institute of Information Technology.

machine elements, such as gears, shafts, and bearings, are critical components of a mechanical device. these machine elements are designed in order to meet certain requirements. in this article, the following design criteria are discussed: design of the machine elements. design of the machine elements under fatigue. design of the machine elements for multiple component assemblies. design of the machine elements for multiple component assemblies under fatigue. design of the machine elements with variable center distance and variable moment of inertia. design of machine elements can be divided into two parts, namely, the analytical design and the dimensional design. the former includes application of design criteria to develop a design specification or a design requirement. the latter part includes the determination of the geometric dimensions of the machine element based on the design criteria. this article discusses these two components. the international standards for dimensioning and design of machine elements are the iso 1:2000 and the iso/tr-3502:2001. this article discusses iso 1:2000 and iso/tr-3502:2001 and focuses on the compatibility of these standards with the design of machine elements. iso 1:2000 and iso/tr-3502:2001 are still applicable but the iso guidelines have been superseded by iso/tr-10025:2001. the article also discusses how iso 1:2000 and iso/tr-3502:2001 can be used to develop a design of machine elements. the necessary details and required calculations are discussed. finally, the incompatibility of the iso standards is demonstrated for the design of a gear. 5ec8ef588b
