But let's be honest, we all know that buying software for PCs and Macs can be a tricky process. If you're not careful, you may find yourself spending way too much money or, even worse, buying software you don't really need. Sometimes, you just have to look a little harder to find the deals you want. Installing Adobe Photoshop is relatively easy and can be done in a few simple steps. First, go to Adobe's website and select the version of Photoshop that you want to install. Once you have the download, open the file and follow the on-screen instructions. What's especially nice about Lightroom 5 is how easy it is to organize, manage, and work with your images. By default, Lightroom comes with a simple arrangement of images, known as "Death by a Thousand Files." This arrangement is what I consider the most efficient, but it's not the only option. You can create a folder of your own. You can pile up subfolders under that and add subfolders to it, too. You can merge extra images into a database, but then you have to create your own database. There's no way to do that, yet, in Lightroom, with the exception of the Output module. You can also duplicate existing folders or potentially even move folders they way you like. And you can move images from the library to the "Collections" folder so they don't clutter up your memory. It's a really powerful way to quickly build and preserve a library of images that you can use as a reference over time. And you can easily apply various editing presets or filters to images in a folder, including their ids.

There's not a ton of room for moving or squishing images in Lightroom 5. So you need to mind how you store them. If possible, it's best to keep them in the DNG format because that's the most versatile and compatible storage format available. It will also make exporting them significantly faster. (If you export images from Lightroom 5 instead of exporting them from Lightroom 4, and you chose the "RAW + JPEG" option, however, you will have to process them by opening them in Photoshop or other image editing program. Lightroom's RAW-to-JPEG converter is for exporting images in the JPEG format only.) If you're syndicating images, it's best to keep them in a digital folder, preferably one of your own that is shared with others. It would be a good idea to name the folder with only the file extension (for example, DNG_1.JPG), so you can drop files into it, directly,

rather than saving them to a directory first by clicking Open. If you subdivide, you can connect to a network or to a local area network and import images into Lightroom 5 via that connection, rather than disc, as long as all your computers and tablets of networked devices are configured for that.

It also offers a new Paint Bucket tool to fill in a specific spot in an image using shapes rather than a blurred effect. You're tasked with designing a new logo for a sports apparel company. You start by researching and gathering a variety of photos from old players who wore a similar uniform or play-by-play footage of previous games won in this era. This information allows you to model the new logo design on these photos. You're starting with a point-cloud model, and you're modeling the logo by allowing Photoshop to create a pattern that looks like a uniform and then you're going to apply several different textures to mimic various materials, including a nylon, leather, and plated material.
