As a photography software, Adobe Lightroom is one of the best, with Adobe Photoshop falling in line as a close second. However, newcomer Lightroom 5 is definitely worth taking a closer look at. Apple users can pick up Lightroom 5 for free, but whether to choose Lightroom over Photoshop is up to you. Lightroom 5 comes with a few new features for the iPad version, which is impressive and impressive. Many others will also use Lightroom for the iPad, as it is the perfect mobile photography software for the smartphone user. The iPad version of Lightroom 5 has a few new features, such as Auto Enhance Suggestions, Collections, a new feature to preview upcoming projects, and a new way to boost your cloud storage. The Clipboard feature allows users to easily move content from device to device, and you can now preview photos in their entirety, utilizing the dual monitor feature of iOS. There is a new option in Lightroom called "Auto Enhance Suggestions." This feature is useful for users that are already experienced in manually enhancing images, such as cropping, color correcting, sharpening, and removing unwanted objects. "Auto Enhance Suggestions" automatically suggests regions of interest in your images for auto-adjustments that are similar to editing done in your software of choice. These adjustments include auto-blur, auto-sepia, or auto-white balance adjustments (ISO/saturation and Vibrance). Before CS6, I used Photoshop (the older version) almost exclusively. I didn't want to use the plug-ins, because I'm not a programmer; and I did not know how to make great images. I was afraid that if my skills were deemed to be average or worse—the result of a lack of experience in postproduction—then I would not be hired as a fashion photographer.

The good news is that there's a similar type of editing in Photoshop that Lightroom does too - we call it Smart Preview. This is basically real time adjustments for exposure, brightness and color. It's a great way to get non-destructive and direct feedback without having to wait for it to be saved. If you're just starting out, I would recommend you learn how to use the basics of this type of editing first and then work down to the details of how to do it in Photoshop. To do this, you must open an image in Photoshop and apply a change to it. Once you've done that, you can save the changes as a layer so that you can keep them separate from the original photo. When you're ready to apply the edits to another image, just paste the altered layer into the new image. (In the early versions of Photoshop, you had to duplicate each layer just to make a separate copy of it, but with modern versions, all layers can be duplicated almost anywhere on the canvas.) An important rule to keep in mind when you edit a photo in Photoshop is to *not* save your image to another location until after you've applied all of your changes. Otherwise, you may end up accidentally changing an original setting that you want to keep.
