The New Artboard Diagram view card is a biggie, but only if you're creating --> is a biggie, but only if you're creating new images or re-sizing and moving existing images. Adobe Photoshop and Elements reflect the evolution of MacOS and App Store standards. Adobe professional products, including the software versions, are restricted as MacOS apps are, and like all apps from Apple/Apple store, they have no adware or spyware installed. Adobe Photoshop and Elements both feature a very well-thought-out page for selecting the brush types. This allows for quick and precise evaluations as well, with a well-developed library of appropriate brushes for a given image type. Photoshop's brushes offer a high degree of control, so you can get any look you want, and each brush type gives you the ability to modify those particular brush properties: This means you can adjust the softness, hardness, opacity and many other brush parameters to fine-tune the brush's behavior — perfect for getting just the right touch of subtlety or drama to a specific section of your photo. One of the best new features is the addition of layers: You can now navigate them as easily as you navigate Photoshop brushes. The software's layer panel has complete functionality, including adding masks, moving and blending them, and even changing their opacity.

I've written before about my plugins pick and in fact, some plugins came about from my frustration at not having been able to use them properly. There are a lot of web design plugins available today of all shapes and colours. Some are good, some are bad.
