Related Art A recording apparatus such as an ink jet printer can record images, letters, and the like on a recording medium by discharging ink stored in a pressure chamber of a recording head. Some recording apparatuses are provided with a suction-recording mode in which a pressure chamber is forcibly deformed when ink is not discharged from the pressure chamber and is sucked back into the pressure chamber in order to prevent the occurrence of defects on the recording medium due to the ink that is not discharged. A recording head that is capable of high-speed printing is provided with a suction channel that communicates with the pressure chamber and a control section that controls the suction channel to be intermittently supplied with suction air. However, because the pressure chamber is sealed, it is difficult to maintain proper pressure in the pressure chamber. If the air in the suction channel or the pressure chamber is replaced by a fluid, pressure variation will occur in the pressure chamber in the suction-recording mode of the recording head.Q: Can a 0-weight subspace of a Hilbert space be isomorphic to its orthogonal complement?
