The Brush tool, along with the eraser tool and shape tools, is versatile enough to cover almost every project that most photographers work on. Its size, shape, and opacity are influenced by how much of the foreground color you tap. You can also adjust the brush size and opacity (using the Stroke Panel) to make fine adjustments to your details. The brush size can be scaled up or down, and its diameter can be modified with values ranging from **1.00** to **176.00**. The Brush tool works much like the Eraser tool. You select, click, drag to erase an area, refine the selection, or fix selection errors, and when you're done, save your work in either Photoshop or Photoshop Elements. The Paint Bucket is a well-liked alternative to the Brush Tool and also offers a variety of sizes and shapes that can be scaled up or down, along with opacity values ranging from **0.00** to **100.00**. In today's world, we use photoshop almost daily and its almost natural that we try our best to get the most out of it. Photoshop, by default, has a zoom setting of 100%. Zoom in/out is not really available in the darkroom. In the darkroom, the most convenient and easiest way to make fine adjustments is to change the sharpness of the image that you are about to print (i.e., - the image's DPI). So what is 100%? The 100%

refers to the pixels in your image. Depending on what you have made, it might be difficult to get your image to print at 100%. I really think that its important to understand that 100% does not mean 100% of the photo. If you knew how many pixels make a photo on a standard size paper, you might be able to get close to the actual size of the photo. But you would not be able to see your photo at 100%. e3d0a04c9c
