Adobe's deep learning solutions are powered by the Adobe Sensei machine-learning engine, which can identify up to 40 different objects in an image, detect faces, describe people and common editing styles, recognize the mood of a scene, and tag particular images based on content. An example of these technologies is the face detection and recognition system, which appears when it detects someone in a photo. Technology is trained to identify who is in the image based on their appearance, age, gender, and ethnicity. In this instance, the photo is from the photographer at the time of the image capture (it was taken during a photoshoot). By enabling machine learning directly in the most trusted image editing workflow application, Adobe is creating unprecedented experiences for users to own, manage, and share work in a new, shared reality.
